Glitter

Plastic Glitter - Small & Large

Brodie & Middleton glitter is a safe form of hexagonal pvc plastic glitter designed for theatrical use. The large 0.40" / 1000 micron size of the flakes allows for effective use on-stage. The 'large' 1/8" / 3125 micron gold and silver glitter is square and will also 'flitter' when dropped.

Glitter can be used loose or made into a glitter paint with glaze or fire retardant water-based lacquer. Glitter will adhere well to spray-mount, PVA, Copydex, varnish and glaze. Due to its coarseness, applying glitter as a paint, requires several coats to obtain an even coverage. Best results are obtained by spraying.

100 g now in clear re-useable pots and a range of more unusual colours in 125g shaker pots.

Fluorescent Glitter

This glitter is made using UV reactive dyes and will fluoresce under black light.

Holographic Glitter

This glitter is sometimes known as Alpha Jewels. The glitter has a metallic base colour and is iridescent.

Pearlised Glitter

As above, but with white as the base colour.

Polyester Glitter

Polyester is a more stable material than pvc. Glitter made from this material is brighter, lasts longer and is less prone to leaching in solvents. Our gold and silver polyester glitter is a 200 micron / 0.008" grade and is fine enough to be sprayed or silk screened.

Flitter

Brodie & Middleton Flitter is made from large (50mm x 22mm) pieces of light metallised foil glitter, which flutter when dropped. It is used for glitter drops and bombs and is designed to be flame retardant and colourfast.

Iridescent Snow

Iridescent random cut white polyester film. This material is very light and makes fantastic decorative snow effects.

Paper Snow

Looks like the real thing. Shredded and treated film flakes. Ideal for use with snow & wind machines.

17 litres = 3 sq. m
58 litres = 10 sq. m
Depth approx. 5 mm
